Kurt Gale (kgale2)

Our project idea deals with phishing. Specifically, typosquatting. We want to make a chrome extension that detects when the browser visits a site whose URL is very similar to a common URL and warns the user that they are not actually on the site. For example, if the user meant to go to [www.google.com](http://www.google.com) but accidentally typed [www.gooogle.com](http://www.gooogle.com), our extension would warn them. The extension would also scan the webpage and look for links that appear to link to sites with this same problem.
